Print Linked List

Difficulty: Basic Accuracy: 60.71% Submissions: 141K+ Points: 1

Given a linked list. Print all the elements of the linked list separated by space followed.

Examples:

Input: LinkedList : 1 -> 2

Output Window

Compilation Results Custom Input Y.O.G.I. (AI Bot)

Expected Output:
1 2

Output Difference
1 2

Ask Yogi Bot

```
1 // Driver Code Ends
2
3 struct Node {
4     int data;
5     struct Node* next;
6 }
7
8 Node(int x) {
9     data = x;
10    next = nullptr;
11 }
12
13 // Print elements of a linked list on console
14 // Head pointer input could be NULL as well for empty list
15
16 class Solution {
17 public:
18     // Function to display the elements of a linked list in same line
19     void printList(Node* head) {
20         // your code goes here
21     }
22 };

83. Remove Duplicates from Sorted List

Easy Topics Companies

Given the head of a sorted linked list, delete all duplicates such that each element appears only once. Return the linked list sorted as well.

Example 1:

Input: head = [1,1,2]
Output: [1,2]

```
1 class Solution {
2 public:
3     ListNode* deleteDuplicates(ListNode* head) {
4         if (!head) return nullptr;
5         ListNode* current = head;
6         while (current && current->next) {
7             if (current->val == current->next->val) {
8                 ListNode* temp = current->next;
9                 current->next = current->next->next;
10                delete temp;
11            } else {
12                current = current->next;
13            }
14        }
15        return head;
16    }
17 }
```

206. Reverse Linked List

Solved

EasyTopicsCompanies

Given the head of a singly linked list, reverse the list, and return the reversed list.

Example 1:

Input: head = [1,2,3,4,5]
Output: [5,4,3,2,1]

Example 2:

2095. Delete the Middle Node of a Linked List

MediumTopicsCompaniesHint

You are given the head of a linked list. Delete the middle node, and return the head of the modified linked list.

The middle node of a linked list of size n is the $\lfloor n / 2 \rfloor^{\text{th}}$ node from the start using 0-based indexing, where $\lfloor x \rfloor$ denotes the largest integer less than or equal to x.

- For n = 1, 2, 3, 4, and 5, the middle nodes are 0, 1, 1, 2, and 2, respectively.

Example 1:

Input: head = [1,3,4,7,1,2,6]
Output: [1,3,4,1,2,6]
Explanation:
The above figure represents the given linked list. The indices of the nodes are written below.
Since n = 7, node 3 with value 7 is the middle node, which is marked in red. We return the new list after removing this node.

21. Merge Two Sorted Lists

EasyTopicsCompanies

You are given the heads of two sorted linked lists `list1` and `list2`.
Merge the two lists into one **sorted** list. The list should be made by splicing together the nodes of the first two lists.
Return the head of the merged linked list.

Example 1:

82. Remove Duplicates from Sorted List II

MediumTopicsCompanies

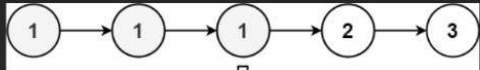

Given the `head` of a sorted linked list, delete all nodes that have duplicate numbers, leaving only distinct numbers from the original list. Return the linked list **sorted** as well.

Example 1:

Input: head = [1,2,3,3,4,4,5]
Output: [1,2,5]

141. Linked List Cycle

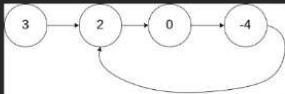

Easy Topics Companies

Given `head`, the head of a linked list, determine if the linked list has a cycle in it.

There is a cycle in a linked list if there is some node in the list that can be reached again by continuously following the `next` pointer. Internally, `pos` is used to denote the index of the node that tail's `next` pointer is connected to. **Note that `pos` is not passed as a parameter.**

Return `true` if there is a cycle in the linked list. Otherwise, return `false`.

Example 1:

Input: `head = [3,2,0,-4]`, `pos = 1`
Output: `true`
Explanation: There is a cycle in the linked list, where the tail connects to the 1st node (0-indexed).

Example 2:

92. Reverse Linked List II

Medium Topics Companies

Given the `head` of a singly linked list and two integers `left` and `right` where `left <= right`, reverse the nodes of the list from position `left` to position `right`, and return the reversed list.

Example 1:

Input: `head = [1,2,3,4,5]`, `left = 2`, `right = 4`
Output: `[1,4,3,2,5]`

Example 2:

61. Rotate List

MediumTopicsCompanies

Given the `head` of a linked list, rotate the list to the right by `k` places.

Example 1:

Input: `head = [1,2,3,4,5]`, `k = 2`
Output: `[4,5,1,2,3]`

Example 2:

Code

Testcase

```
C++  
23  
24  
25 // Break the loop and set the new head  
26 head = temp->next;  
27 temp->next = nullptr;  
28  
29 return head;  
30  
31 }  
32
```

148. Sort List

MediumTopicsCompanies

Given the `head` of a linked list, return the list after sorting it in *ascending order*.

Example 1:

Input: `head = [4,2,1,3]`
Output: `[1,2,3,4]`

Example 2:

Code

Testcase

```
C++  
39 tail = tail->next;  
40 }  
41 tail->next = ll ? ll : 12;  
42 return dummy.next;  
43  
44 }  
45
```

142. Linked List Cycle II

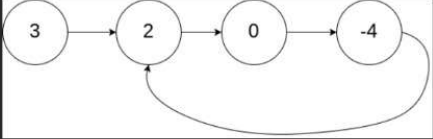

MediumTopicsCompanies

Given the `head` of a linked list, return *the node where the cycle begins*. If there is no cycle, return `null`.

There is a cycle in a linked list if there is some node in the list that can be reached again by continuously following the `next` pointer. Internally, `pos` is used to denote the index of the node that tail's `next` pointer is connected to (**0-indexed**). It is `-1` if there is no cycle. **Note that** `pos` is not passed as a parameter.

Do not modify the linked list.

Example 1:

```
graph LR; 3((3)) --> 2((2)); 2 --> 0((0)); 0 --> -4((-4)); -4 --> 2;
```

Input: `head = [3,2,0,-4], pos = 1`
Output: tail connects to node index 1
Explanation: There is a cycle in the linked list, where tail connects to the second node.
